

Kestra's Assignment

Everyday we get this excel file which needs to be processed. Attached is the sample excel file. Feel free to add more records for your testing.

This excel file has two sheets. Sheet "Account" contains the account master data (you may receive or not new records every day). Sheet "Transaction" contains the transaction data.

Design database schema and develop a ssis package to process this file. Take into account that old records should persist in the database.

This package shall include appropriate:

1. Error handling
2. Log business level events and errors (i.e data conversion, number of rows transferred/updated, start, end, etc.)
- 3- Process must be re-runnable (process same files multiple times) leaving the data in a healthy state.

Required:

Use BIDS 2008

Visual Studio 2008
